| <i>Current Stocking:</i> | brook trout; stocked every two years with spring yearlings |
| <i>Historic Stocking (last year stocked):</i> | none |
| <i>Contaminants (species tested):</i> | no testing done |
| <i>Assessment:</i> | Completed Projects: |
| | 1974 lake survey |

Synopsis

Netting results from a 1974 lake survey revealed the presence of common white suckers and some minnow species in the lake but no sport fish. Brook trout were introduced in 1987 and the lake is currently stocked with brook trout on a two-year rotation. Correspondence from an angler who routinely visits the lake suggests the very strong possibility of some natural reproduction occurring. A visit to the lake in January 2000 resulted in the capture of brook trout. An fin clip was found on 13 fish that were caught indicating a stocked origin. The remaining fish may have been produced naturally or, as previously speculated, may have migrated in from Little Whetstone Lake.
